

Introducing Choronzon: An approach at knowledge-based evolutionary fuzzing

Zisis Sialveras (<u>zisis@census-labs.com</u>) Nikolaos Naziridis (<u>nullsem@census-labs.com</u>)

# ZERO GHTS \$ whoami;

# Nikolaos Naziridis

- researcher at CENSUS S.A.
  - Vulnerability research, reverse engineering, exploit development
- fuzzing enthusiast
- aspiring CS graduate student from A.U.Th.
- hates feta cheese

CENSU

### Zisis Sialveras

- trying to graduate from Electrical and Computer Engineer Department in A. U.Th
- works as 9 to 5 reverser and vulnerability researcher at CENSUS S.A
- loves feta cheese

# **Outline of presentation**

- Introduction and motivation
- Related Work
- State of the art fuzzers
- A walk through Choronzon
- Comparison with other fuzzers
- Conclusion / Future Work

★ WARNING: there are fuzzed images with Choronzon throughout the presentation

# Motivation 1/2

NIGHTS

Stop re-inventing the wheel

ZERO

- "same, same, but different! but still same!" ~ James Franco
- re-use code and tools developed for other targets
- Targets across many platforms, need cross-platform fuzzers
- Need to attack binary targets
- Insight about a target file format makes a fuzzer smarter than a brick

# Motivation 2/2

- Different methods apply better to different targets
  - need for extensible / modular design
  - quick evaluation of an approach
- Evolutionary algorithms are the new hip thing to do
  - (and they work well)

# What's evolutionary fuzzing ?

 Paradigm of natural selection applies also to fuzzing

ZERONGHTS

- genes are mutated randomly
- new genes are produced
- only the fittest survive

CEN

- nature explores the possible combinations of genes in a chromosome
- How does this apply to fuzzing ?

# Notable prior work 1/2

- Sidewinder: An Evolutionary Guidance System For Malicious Input Crafting/Embletton, Sparks, Cunningham @ BH-USA 2006
  - representation of the file format using Context Free Grammars (CFG)
  - calculates the fitness of a seed file using a statistical model (Markov Process)
  - instrumentation done by setting up breakpoints to each basic block
- Revolutionizing the Field of Gray-Box Fuzzing Attack Surface using Evolutionary Algorithms/DeMott @ BH-USA & DefCon 2007
  - designed to work specially for network protocols

• introduced interesting approaches to mutation of seed files

### Notable prior work 2/2

- Automated Whitebox Fuzz Testing -- Godefroid, Levin, Molnar @ Microsoft Research 2008
  - symbolic execution
  - instruction instrumentation using iDNA framework
  - presents very interesting results and observations
- Many more academic (and not) papers can be found on the Internet

### State-of-the-art fuzzers

- Asking who's the best fuzzer out there is like asking which is the best programming language (it's C)
  - $\circ$  obviously, the major concern is to produce crashes
  - however, can the fuzzer handle all possible situations ?
  - how about performance, robustness and ease of use ?
- Quick overview of modern open-source fuzzers
  - advantages and disadvantages
  - unique features

#### **State-of-the-art fuzzers**

# Introducing Choronzon

# **Introducing Choronzon**

- A few buzzwords:
  - modular
  - distributed
  - cross-platform
  - source-code agnostic
  - knowledge based

- Target range:
  - Intel architecture
  - Linux, Windows, OSX,
    - Android
  - binary targets

#### **Architecture overview**

- Central driver for fuzzing seems nice, but it's really not
   o database solutions are VERY slow
- Dump interesting files every now and again
- Watch-dog process updates interesting files pool regularly from the dump directory
  - watch-dog monitors remote share for communication among multiple instances of Choronzon
  - rudimentary file locking to avoid race conditions

# Terminology

• Chromosome == seed/test file

ZER

- **Gene** == basic structural component of a file
- **Generation** == a collection of mutated files
- **Elitism** == the process of selecting the best test files
- Population == the current and previous generation
   o an elite generation and its derived generation
- **Fitness** == scalar score of each chromo after evaluation
- **Metric** == fitness is calculated using various metrics

# A round of fuzzing 1/2

• A round of fuzzing with Choronzon

ZERONGHTS

- 1. evaluation of initial collection of seed files
- 2. best seed selection based on execution metrics
- 3. generation of new test files from the best seeds
- 4. evaluation of new generation
- 5. check for crashes ;)
- 6. goto (2)

### File format API

### File format API overview

- Converts files to chromosomes
- Focus on flexibility
- API available in python
- Hooks for every step of the parsing
  - custom de-/serializers
  - selection of fuzzable data
  - pre-/postprocessing of test cases
    - checksum fixing, compression, ...

### A taxonomy of file formats

- Chunk-based (PNG, SVG)
   order of chunks matters
- Hierarchical (XML, MP4)

ZERO

parent/child relationship matters

NIGHTS

- Index-based (ELF, FAT32)
  - $\circ$  index tables with positions
- Container (ZIP, DOCX)
  - $\circ$  data encoded in other formats

### **Memory representation**

- Genes are distinct conceptual entities
- Input file becomes a tree of genes
  - serialize() : file -> tree of genes
  - deserialize() : tree of genes -> file
- A chromosome is the tree of genes, the serializer and the deserializer
- Fuzzers only deal with chromosomes

### A simple gene tree

www.zeronights.org

### Let's look at a real-world example

#### **PNG file structure**

#### 8-byte signature

Length	Name	Data	CRC
4 bytes	4 bytes	Length bytes	4 bytes

- - -

Length	Name	Data	CRC
4 bytes	4 bytes	Length bytes	4 bytes

#### Example step 1: Gene

class PNGGene(gene.AbstractGene):

The PNGGene represent a png chunk.

def \_\_init\_\_(self, chunk):
 super(PNGGene, self).\_\_init\_\_()
 self.length = chunk['length']
 self.name = chunk['name']
 self.data = chunk['data']
 self.crc = chunk['crc']

#### Example step 2: Gene serialize()

```
def serialize(self):
    // dump chunk
```

```
bytestring = ''
```

data = self.get data()

bytestring += struct.pack('>I', len(data))
bytestring += struct.pack('>I', self.name)
bytestring += data

bytestring += struct.pack('>I', self.crc)

// post-process
return self.fix\_crc(bytestring)

#### **Example step 3: Deserializer**

```
class PNGDeserializer(deserializer.BaseDeserializer):
    111
        A parser for PNG files.
    1.101
    fsize = None
    fstream = None
    chunks = None
    def init (self):
        super(PNGDeserializer, self). init ()
        self.fsize = 0
        self.fstream = None
        self.chunks = list()
```

#### Example step 4: deserialize()

```
def deserialize(self, filename):
    # open PNG file
    qenes = list()
    self. open file(filename)
    self. parse signature()
    // parse PNG
    while self.fsize > self.fstream.tell():
        chunk = dict()
        chunk['length'], = struct.unpack('>I', self.fstream.read(4))
        chunk['name'], = struct.unpack('>I', self.fstream.read(4))
        chunk['data'] = self.fstream.read(chunk['length'])
        chunk['crc'], = struct.unpack('>I', self.fstream.read(4))
        self.chunks.append(chunk)
```

#### Example step 4.5: *deserialize()*

# pre-processing
self.\_\_inflate\_IDAT\_chunks(self.chunks)

# initialize PNG genes
for chunk in self.chunks:
 genes.append(PNGGene(chunk))
return genes

#### **Example step 5 - Serializer**

def serialize(self, genes):
 bytestring = PNG\_SIGNATURE
 # pre-processing
 deflated\_genes = self.\_\_deflate\_IDAT\_chunks(genes)
 for gene in deflated\_genes:
 bytestring += gene.serialize()
 return bytestring

#### **Seed evaluation**

# **Evaluation overview**

• Evaluate test files using execution statistics

ZER

- 1. disassemble executables into basic blocks
- 2. trace the execution of target executable images
- 3. use the traced basic blocks and the blocks of the images to calculate metrics, like basic block coverage
- 4. use metrics to calculate fitness, a scalar value
- Elitism is just sorting the generation by chromosome fitness

# **Collecting execution traces**

- Alternative solutions to execution tracing
  - binary instrumentation, e.g.: Intel PIN, Dynamorio
  - binary patching, e.g.: libdyninst

ZERONGHTS

- source-code instrumentation, e.g.: AFL approach
- kernel provided statistics, e.g.: IPT/BTS
- plain ol' debugging
- All have advantages and disadvantages
- Binary instrumentation is the most generic technique

#### Instrumentation in Choronzon

- Binary Instrumentation with Intel PIN
  - o pros
    - most robust solution
    - works on all major platforms
    - easy to setup and use
  - cons
    - staggering performance overhead (at least 30%)
    - works only on Intel architectures

### **Disassembly in Choronzon**

# • Disassembling with IDA Pro

- o pros
  - works on most major platforms / architectures
  - supports wide range of formats
  - easy integration in our workflow
- CONS
  - it's heavy
  - it's buggy

### Fitness and metrics 1/2

- Choronzon should walk as many unique paths in an executable image as possible
  - $\circ~$  If a test file discovers a new basic block, it's elite
  - elite chromosomes survive to the next generation
- If two chromosomes have discovered the same path, compare their fitness to resolve the conflict

# Fitness and metrics 2/2

• Metrics used in Choronzon

ZER

- *basic block coverage* (unique trace bbls / total image bbls)
- o code commonality (unique trace bbls / total trace bbls)
- Fitness is the combination of coverage and commonality
  - metrics are not equally important

NIGHTS

- preliminary normalization
- use weights on normalized metrics to calculate fitness

Ben Nagy @rantyben

Watching image fuzzers run is like sprinting through an abstract art exhibition. On acid. Forever.

# **Fuzzing Methodology**

- Fuzzing is similar to random walking inside a search space
  - aggressive mutations search for global maxima
  - smalls changes explore local maxima
- The two basic concepts of fuzzing in Choronzon are
  - Mutators
  - Recombinators
- "Bogus files find few bugs" ~ Godefroid

### Mutators gonna mutate

- Genes are responsible to pass the fuzzable data to the mutators.
- Choronzon implements a wide range of mutators.
  - bytestring and line-ended string specific mutators
  - add/swap/remove/duplicate bytes, words, dwords and qwords
  - set or unset high bits
  - regular expression based mutators
  - and the powerful random byte mutator!

#### **Recombinators 1/2**

- Recombination is not a common feature among fuzzers
  - $\circ$  it seems to work well though
- In Choronzon, recombinations can occur between two chromosomes
  - $\circ$   $\,$  add a gene from one chromosome to the other  $\,$
  - swap similar genes between two chromosomes

NIGHTS

- Or it can mean the restructuring of a single chromosome
  - adding/duplicating/swapping/removing genes from a chromosome
  - changing the position of a single gene in the chromosome
  - $\circ$  shuffling of two or more genes in the chromosome
- Hierarchical recombination

ZERO

 smart recombination for chromosomes with complex gene trees

#### **Recombination Example**

<parent> <child1> <grandchild1> </grandchild1> </child1> <child2> </child2> </parent>

<PARENT> <CHILD1> </CHILD1> <CHILD2> <GRANDCHILD2> </GRANDCHILD2> </CHILD2> </PARENT>

<parent>
 <child1>
 <GRANDCHILD2>
 </GRANDCHILD2>
 </GRANDCHILD2>
 </child1>
 <child2>
 </child2>
 </parent>

ZERO NIGHTS

<PARENT> <CHILD1> </CHILD1> <CHILD2> <grandchild1> </grandchild1> </CHILD2> </PARENT>

<parent> <child1> <grandchild1> <CHILD2> <GRANDCHILD2> </GRANDCHILD2> </CHILD2> </grandchild1> </child1>

ZERONGHTS

<PARENT> <CHILD1> </CHILD1> </PARENT>

<parent> <child1> <grandchild1> </grandchild1> </child1> <child2> </child2> </parent>

ZERO NIGHTS

<parent> <child2> </child2> <child1> <grandchild1> </grandchild1> </child1> </parent>

#### **Hierarchical recombination**

<parent> <child1> <grandchild1> </grandchild1> </child1> <child2> </child2> </parent>

<parent> <child1> </child1> <grandchild1> </grandchild1> <child2> </child2> </parent>

#### **Radical hierarchical recombination**

<parent> <child1> <grandchild1> </grandchild1> </child1> <child2> </child2> </parent>

<parent> <grandchild> <child1> </child1> </grandchild1> <child2> </child2> </parent>

### **Dynamic fuzzer evaluation**

- Different pairs of mutators and recombinators apply better to different file formats
- Choronzon uses a lottery "scheduling" algorithm
  - instead of a time share, a pair is allowed to generate a file
  - $\circ$  if it's elite, the pair is more likely to be selected again
- Evaluation feedback drives the generation of new chromosomes

#### **Fuzzer evaluation samples**

Recombinator - Mutator	score(PNG)	score(DOCX)
AdditiveSimilarGene - RandomByte	6	1
RandomGeneInsert - SwapDword	5	1
SimilarGeneInsert - SetHighBit	5	0
DuplicateGene - AddRandomData	1	4
SimilarGeneSwap - SwapLines	0	4
AdditiveSimilarGene - RemoveLines	1	5

### Choronzon vs AFL vs Honggfuzz

ZERO NIGHTS

### **Comparison of the fuzzers**

- Comparison of implementation details
  - performance
  - $\circ$  seed file evaluation
  - fuzzing techniques
- There's no best fuzzer
  - no quantitative comparison
  - discussion of different approaches
  - $\circ$  they all have found real world bugs

CEN

#### **Performance - AFL**

# American Fuzzy Lop

- all about performance
- $\circ$  compile time instrumentation
- introduced fork server
  - avoid time consuming process initialization
- prefers small files
- memory and time restrictions

### Performance - Choronzon, honggfuzz

# Honggfuzz

- $\circ$  uses BTS for instrumentation
  - although it's a hardware feature, decoding takes too much time
- No optimizations for performance

# Choronzon

- Python & PIN give high overhead
- No optimizations for performance

CEN

### Seed file evaluation - hongfuzz

- Honggfuzz
  - each thread of honggfuzz grabs a file from the initial corpus.
  - $\circ$  is its coverage better ?
    - no, drop it
    - yes, keep it as the best

### Seed file evaluation - AFL

# American Fuzzy Lop

- maintains a global map of bbl transitions seen so far
- $\circ$  discovered a new transition ?
  - yes, add it to the queue
  - no, discard it
- o exec\_time \* file\_size
- how many times each edge was visited

#### Seed file evaluation - Choronzon

# • Choronzon

- keeps a global map of each basic block for every instrumented image
- hit new basic block ?
  - yes, keep it
  - no, find better by checking fitness & hit count of bbl

# Honggfuzz

- various mutators
  - random byte mutation

ZERONGHTS

- move blobs of data to a different position in file
- random file truncation
- etc.
- use seeds generated by another tool

# **Fuzzing techniques - AFL**

# American Fuzzy Lop

- deterministic selection of mutators
- input file trimming
- $\circ$  read custom dictionary of fuzzing vectors
- file splicing
- custom post handler

# **Fuzzing techniques - Choronzon**

### Choronzon

- wide range of mutators and recombinators
- file format knowledge

ZERO

- efficient fuzzing of complex file formats
- focus on interesting parts of a format
- dynamic evaluation of fuzzers

NIGHTS

- fuzzers adapt to the target file format
- aims to generate mostly sane test files

#### XML - fuzzer evaluation kicks in

ZERO NIGHTS

www.zeronights.org

#### ZERO

#### Unique basic block sample

CENSUS IT Security Works

www.zeronights.org

#### State-of-the-art fuzzers

	FOE	Peach	honggfuzz	AFL	Choronzon
Windows Support	1	V			$\checkmark$
Feedback driven			$\checkmark$	<b>V</b>	<b></b>
Source Code Agnostic	<b>V</b>	V	$\checkmark$		V
Inter-file mutation				<b>V</b>	<b></b>
Aware of file format		<b>V</b>			<b></b>

### Conclusion

### ZERO

### Lessons learned

- Performance is very important!
- Knowledge about the file format makes a difference
  - saves time by ignoring non-relevant parts
  - makes fuzzing more flexible
- Dynamic evaluation of fuzzers reduces the number of less interesting test files
- Recombination seems to reach parts of executables, traditional mutators don't

# **Future Plans**

Increase Choronzon's performance

NIGHTS

- test multiple instrumentation backends
- Implement support for index-based file formats
- Release the source code

ZERO

#### Questions

www.zeronights.org
